Methods & Indicator Overview

College Hill

Cincinnati Neighborhood Profile

College Hill is a predominantly Black neighborhood (62.7%) with around ~16,150 residents. It has active community councils (College Hill Community Council), a community development corporation (College Hill Urban Redevelopment Council), and the College Hill Neighborhood Business District Urban Renewal Plan. The average life expectancy for the neighborhood is 74.8 (ranking 18th of all communities assessed). College Hill has a relatively average prevalence of diabetes (15.8%), kidney disease (3.6%), and heart disease (15.8%) of all communities assessed, but "high" levels of cancer (6.8%). The neighborhood has ~33.7% tree canopy cover (ranked 13th of all communities assessed), and is ranked 14th of all communities assessed for percent of land in parks and greenspaces (19.5%). College Hill has "low to excellent" access to public transit and "below average" walkability. It has "low" exposure to air toxins that cause cancers and respiratory hazards, "moderate" exposure to traffic and potential lead paint, and "very high" exposure to PM2.5 levels and ozone concentrations. In addition, it has "moderate" exposure to potentially toxic industrial sites and hazardous waste treatment and disposal sites, but "very high" exposure to Superfund sites. College Hill ranks 16th of all communities assessed for persons living in poverty (18.2%) and 17th for number of SNAP recipient households (14.7%).

Indicator Information

<i>Indicator</i>	<i>Definition</i>	<i>Unit</i>	<i>Rationale for Inclusion</i>	<i>Source</i>
Population	The total permanent resident human population of a neighborhood as derived from U.S. Census tracts or block groups, where applicable.	# of Persons	Human beings are the unit of reference whose relative adaptive capacity or sensitivity to climate-driven hazards and systemic inequities is assessed in this report and aggregated at the neighborhood level.	U.S Census Bureau American Community Survey 5-year Estimates (2014-2018) Found in: <ul style="list-style-type: none"> Centers for Disease Control Social Vulnerability Index (Census Tracts) Environmental Protection Agency Environmental Justice Screening Tool (Census Blocks)
Persons over 65	The total permanent resident population of human beings whose age is over 65 years.	# of Persons; % of Total Population	Although the effects of aging vary markedly between individuals, individuals over age 65 are generally considered to be more vulnerable to the effects of extreme heat, flood events, and environmental pollution, and are more likely to have physical disabilities necessitating additional measures during disaster events.	U.S Census Bureau American Community Survey 5-year Estimates (2014-2018) Found in: <ul style="list-style-type: none"> Centers for Disease Control Social Vulnerability Index (Census Tracts), "E_AGE65"
Persons 17 and Under	The total permanent resident population of human beings whose age is 17 years or fewer.	# of Persons; % of Total Population	Children face significantly higher sensitivity to environmental and anthropogenic hazards, and often lack the skills, tools, and social license to respond adequately to disaster events and processes of long-term change. During disaster events, special considerations must be taken to ensure children's physical and mental health is protected to avoid long-term impacts.	U.S Census Bureau American Community Survey 5 year Estimates (2014-2018) Found in: <ul style="list-style-type: none"> Centers for Disease Control Social Vulnerability Index (Census Tracts), "E_AGE17"
Children Living w/ Grandparents	The population of children living in households whose head of household is their grandparent.	# of Persons; % of Total Population	Included as a metric of how many children may live in the same household as elderly persons. This does not include multi-generational households where the child's parents are head of household, but does reflect cases where the combined sensitivities of both elderly persons and children may compound each other.	U.S. Census Bureau American Community Survey 5-year Estimates (2015-2019) <ul style="list-style-type: none"> "B10001_001E", accessed via the ESRI Demographics Feature Service Directory

Indicator Information

Indicator	Definition	Unit	Rationale for Inclusion	Source
Life Expectancy	<p>The number of years of life that an average human being can expect based on the neighborhood in which they were born as determined from Ohio Department of Health, Cincinnati Health Department, and U.S. Census Bureau mortality data by Cincinnati Insights for the period of 2007-2015.</p>	Years	<p>The ultimate metric of human health and well-being is the time during which they are alive. Cincinnati's life expectancy is 76.1 years overall for the period from 2007-2015, with females living on average 80.8 years and males living on average 75.1 years. However, substantial and severe disparities exist between racial groups and neighborhoods as a reflection of the dramatically divergent experience of life and collective insults to survival that occur within neighborhoods and across individuals. In the longest-lived neighborhoods, individuals can expect up to 87.8 years of life (Mt. Adams), putting it on par with the longest-lived nations in the world. In neighborhoods with the lowest life expectancy, (e.g. Lower Price Hill, Queensgate, Sedamsville) individuals average only 63-64 years of life, putting them on par with developing countries without meaningful civic, health, electrical, or water delivery infrastructure. Climate-driven hazards and disaster events will likely further exacerbate these inequities and patterns of excessively premature mortality.</p>	<p>City of Cincinnati and Cincy Insights Life Expectancy Dashboard (2007-2015 Data)</p>
Asthma	<p>The number of human beings likely to have asthma or equivalent respiratory diseases, as estimated by the CDC PLACES: Local Data for Better Health Program.</p>	# of Persons w/ Condition; % of Total Population	<p>Individuals with asthma may experience increased negative impacts from poor air quality associated with continental scale wildfires occurrences caused by climate change, local air pollution hazards, and other phenomena that result in poor air quality. Moreover, asthma prevalence is among the most readily identifiable indicators of historical and ongoing poor air quality, which may in turn reflect the inadequacy of programs and policies related to pollution control. In Cincinnati, asthma prevalence estimates range from 7.6% to 18.5%, and average 11.3% overall across neighborhoods. For comparison, the national asthma prevalence rate is estimated to be roughly 8%.</p>	<p>Centers for Disease Control PLACES: Local Data for Better Health Program</p> <ul style="list-style-type: none"> • "csthma_cr", in PLACES: Census Tract Data (GIS Friendly Format), 2020 release dataset.
